① One Cohort Block (s, p): stand-age clock h

Unit parcel Δ_A • Bind build year s + lifetime water recipe p

Cover $V(h)$

seedling 2%

17%

Water recipe $q_{p,h}$

100 mm/yr

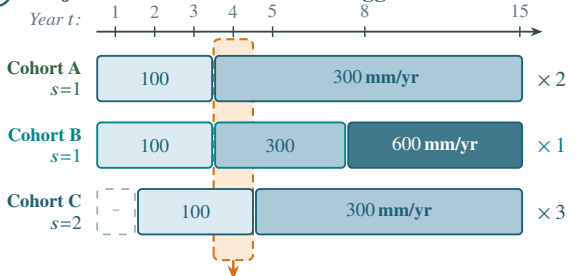

ages h = 1–3

300 mm/yr (stepped up with canopy)

ages h = 4–15

slide to s
stack $\times n_{s,p}$

② Project Calendar $t = 1 \ldots 15$: staggered blocks

One block = one life cycle: bind planting year s with a lifetime watering recipe p so quotas rise as shrubs grow.

At t = 4: Cohort C was planted later and is younger than A and B, so it applies its early-stage rule (100 vs. 300 mm/yr).
